

Brand new factory for Modul

JOST has been manufacturing landing gear winches in Wolframs-Eschenbach (Bavaria) since 1981. Now a new 5,000 sqm production hall equipped with modern machinery has been built for Modul — the latest generation of landing gear winches.

After more than 16 months of planning and construction, complex tests and assembly, the new production plant for landing gear winches opened its series production operations in January. The new plant features the very latest production technology, including two fully automated pressing lines, a welding centre for supporting pipes, a crane that measures almost 100 m in length and interlinked spindle production. Meanwhile, production of the familiar landing gear winches continues in the existing plant.

The new production plant ensures the very highest levels of quality. Ongoing checks and analysis are conducted throughout the entire production process – from the delivery of materials to the dispatch of finished products – thereby guaranteeing an error rate of 0%.

In terms of the integrated quality approach, the complete JOST workforce was involved in building the new production plant. Divided into 12 teams, all the employees were able to contribute their own individual expertise to this multi-million-mark project.
